PERSONAL PORTFOLIO

WEB DEVELOPMENT PROJECT REPORT

A responsive student portfolio website built with HTML5, CSS3 and JavaScript

Project	Personal Portfolio Website
Technology	HTML5, CSS3 and JavaScript
Project Type	Front-end website
Purpose	Educational web development project

Prepared as a simple-English guide to the portfolio layout, its features, and the supplied HTML source code.

1. Introduction

The Personal Portfolio website is a sample webpage designed to introduce a student and present their profile, education, technical skills, hobbies, projects, achievements, resume option, and contact links. The page uses HTML to organise the content, CSS for visual styling, and JavaScript for the mobile navigation menu and automatic year display.

2. Project Objectives

• Create a simple and professional personal portfolio homepage.

• Present profile information and educational qualifications.

• Display technical skills and personal interests.

• Show selected projects and achievements.

• Provide a print or save-as-PDF option for the resume section.

• Add contact links for email, LinkedIn, and GitHub.

• Practise HTML structure, CSS styling, and basic JavaScript events.

3. Technologies Used

HTML5: Defines the page structure, including the header, navigation, sections, project cards, links, and footer.

CSS3: The HTML links to an external stylesheet named web1.css, which is intended to control colours, spacing, layout, cards, and responsive design. The CSS file itself was not included in the supplied source.

JavaScript: Opens and closes the mobile navigation menu, closes the menu after a navigation link is selected, and inserts the current year in the footer.

4. Website Sections

Hero Section: Displays the greeting, student/developer role, short introduction, and a button that moves to the Projects section.

About Me: Introduces the student as a curious learner interested in solving problems and creating digital experiences.

Education: Shows a degree title, university, study period, and relevant coursework. These are placeholder details to be replaced.

Technical Skills: Lists HTML, CSS, JavaScript, Python, Git, and Figma.

Hobbies: Displays reading, photography, music, and exploring new places.

Projects: Shows three sample projects: Daylight Planner, Personal Portfolio, and Neighbourhood Notes.

Achievements: Lists a hackathon finalist milestone, community volunteering, and a web development course.

Resume: Provides a button that calls the browser print function so the page can be printed or saved as a PDF.

Contact: Provides email, LinkedIn, and GitHub links.

5. Important Code Concepts

Semantic sections and IDs: Each main content area has an ID, allowing navigation links such as #about and #projects to move to the matching section.

DOM selection: document.querySelector() selects the menu and navigation elements.

Event listeners: addEventListener() responds to clicks on the menu button and navigation links.

Class toggling: classList.toggle('open') adds or removes the open class on the navigation element. The appearance of this class is controlled by the missing CSS file.

Dynamic year: new Date().getFullYear() obtains the current year for the footer.

Print function: window.print() opens the browser print dialog.

6. Website Output Screenshot

The screenshot below shows the supplied portfolio page, including its introduction, profile, education, skills, hobbies, projects, achievements, resume area, and contact details.

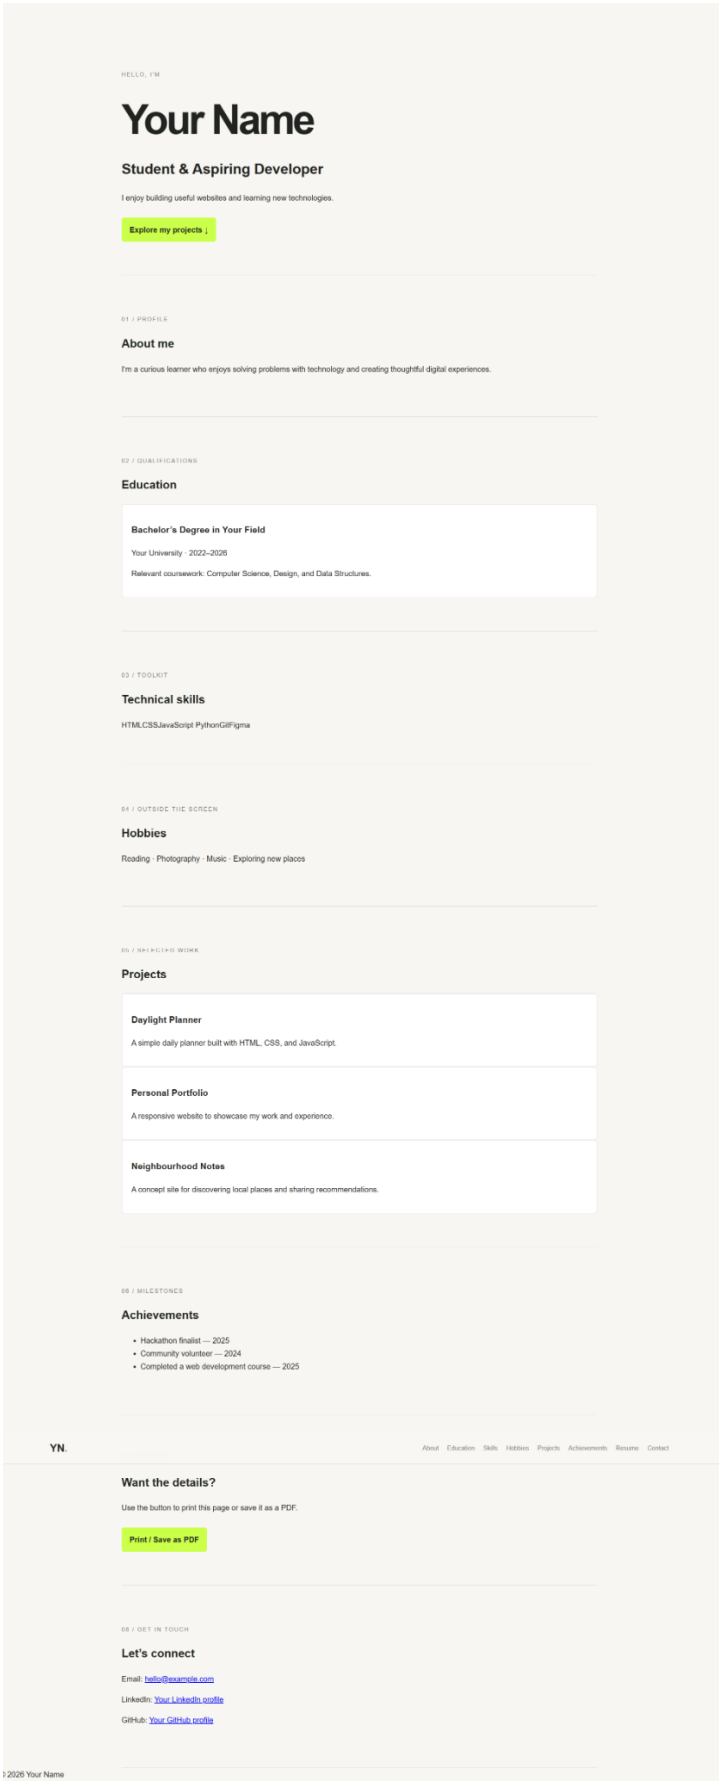

Figure 1. Personal Portfolio website output (user-supplied screenshot).

7. How the Website Works

1. The browser reads the HTML and creates the webpage structure.

2. The browser loads the external web1.css stylesheet to apply the page design.

3. The JavaScript selects the menu and navigation elements.

4. When the menu button is clicked, the script toggles the open class on the navigation.

5. When a navigation link is clicked, the script removes the open class.

6. The script places the current year in the footer.

8. Observations and Improvements

• Replace “Your Name”, “Your Field”, and “Your University” with the correct student and education details.

• Update the sample study dates and coursework so they match the student's actual details.

• Replace the example email and profile links with the student's real intended contact links before publishing.

• Add the missing web1.css file to make sure the intended visual design and mobile layout are applied.

• Replace the sample project names and achievements with genuine work and milestones.

• Test the navigation menu and Print / Save as PDF button in a browser.

9. Conclusion

The Personal Portfolio website demonstrates how HTML5, CSS3, and JavaScript can be used together to create a student profile website. It organises personal information into clear sections and includes project details, achievements, navigation, contact links, and a print option. The supplied HTML provides the structure and basic interactions. The external CSS file is needed to reproduce the complete visual styling shown in the screenshot.

Appendix A. Supplied HTML Source Code

The complete HTML code provided with the project is included below. The linked web1.css stylesheet was not supplied, so only the HTML source is reproduced in this appendix.

```
<!DOCTYPE html>
<html lang="en">
